Description

[0001] The present invention relates to pyridopyrimidines and derivatives thereof. In particular, the present invention provides 2,6-disubstituted 7-oxo-pyrido[2,3-d]pyrimidines, a process for their manufacture, pharmaceutical preparations comprising the same, and methods for using the same.

[0002] Mitogen-activated protein kinases (MAP) is a family of proline-directed serine/threonine kinases that activate their substrates by dual phosphorylation. The kinases are activated by a variety of signals including nutritional and osmotic stress, UV light, growth factors, endotoxin and inflammatory cytokines. One group of MAP kinases is the p38 kinase group that includes various isoforms (*e.g.*, p38α, p39β, p38γ and p38δ). The p38 kinases are responsible for phosphorylating and activating transcription factors as well as other kinases, and are activated by physical and chemical stress, pro-inflammatory cytokines and bacterial lipopolysaccharide.

[0003] More importantly, the products of the p38 phosphorylation have been shown to mediate the production of inflammatory cytokines, including TNF and IL-1, and cyclooxygenase-2. Each of these cytokines has been implicated in numerous disease states and conditions. For example, TNF-α is a cytokine produced primarily by activated monocytes and macrophages. Its excessive or unregulated production has been implicated as playing a causative role in the pathogenesis of rheumatoid arthritis. More recently, inhibition of TNF production has been shown to have broad application in the treatment of inflammation, inflammatory bowel disease, multiple sclerosis and asthma.

[0004] TNF has also been implicated in viral infections, such as HIV, influenza virus, and herpes virus including herpes simplex virus type-1 (HSV-1), herpes simplex virus type-2 (HSV-2), cytomegalovirus (CMV), varicella-zoster virus (VZV), Epstein-Barr virus, human herpes virus-6 (HHV-6), human herpesvirus-7 (HHV-7), human herpesvirus-8 (HHV-8), pseudorabies and rhinotracheitis, among others.

[0005] Similarly, IL-1 is produced by activated monocytes and macrophages, and plays a role in many pathophysiological responses including rheumatoid arthritis, fever and reduction of bone resorption.

[0006] Additionally, the involvement of p38 has been implicated in stroke, Alzheimer's disease, osteoarthritis, lung injury, septic shock, angiogenesis, dermatitis, psoriasis and atopic dermatitis (see e.g. J. Exp. Opin. Ther. Patents, (2000) 10(1)).

[0007] The inhibition of these cytokines by inhibition of the p38 kinase is of benefit in controlling, reducing and alleviating many of these disease states.

[0008] Certain 6-aryl-pyrido[2,3-d]pyrimidin-7-ones, -7-imines and -7-thiones are disclosed as inhibitors of protein tyrosine kinase mediated cellular proliferation in WO 96/34867. Other 6-aryl-pyrido[2,3-d]pyrimidines and naphthyridines are also disclosed as inhibitors of tyrosine kinase in WO 96/15128. 6-alkyl-pyrido[2,3-d]pyrimidin-7-ones are disclosed as inhibitors of cyclin-dependent kinases in WO 98/33798. Certain 4-amino-pyridopyrimidines are disclosed as inhibitors of dihydrofolate reductase in EP 0 278 686A1, In EP 279,565 the use of 2,4-diamino-5-methyl-6-(dialkoxybenzyl)pyrido[2,3-d]pyrimidines for the treatment of rheumatoid arthritis is disclosed.

[0053] In case in the drawings of structural formula in the present description"N" is only shown with one or two bonds to the rest of the structure or "O" is only shown with one bond to the rest of the structure, the person skilled in the art will understand that in the case of "N" two or one "H"-atoms, respectively and in case of "O" one "H"-atom is/are present in the formula but not shown by the computer program used to draw the structures, e.g. ISIS draw. Therefore "-N" represents "-NH_2", "-N-" represents "-NH-" and "-O" represents "-OH".

[0070] The compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms, including hydrated forms, are equivalent to unsolvated forms and are intended to be encompassed within the scope of the present invention. In addition to the compounds described above, the compounds of the present invention include all tautomeric forms. Furthermore, the present invention also includes all pharmaceutically acceptable salts of those compounds along with prodrug forms of the compounds and all stereoisomers whether in a pure chiral form or a racemic mixture or other form of mixture.

[0071] The compounds of Formula I and II are capable of further forming pharmaceutically acceptable acid addition salts. All of these forms are within the scope of the present invention.

[0072] Pharmaceutically acceptable acid addition salts of the compounds of Formula I and II include salts derived from inorganic acids such as hydrochloric, nitric, phosphoric, sulfuric, hydrobromic, hydriodic, phosphorous, and the like, as well as the salts derived from organic acids, such as aliphatic mono- and dicarboxylic acids, phenyl-substituted alkanoic acids, hydroxy alkanoic acids, alkanedioic acids, aromatic acids, aliphatic and aromatic sulfonic acids, etc. Such salts thus include sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, nitrate, phosphate, monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, caprylate, isobutyrate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, mandelate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, phthalate, benzenesulfonate, toluenesulfonate, phenylacetate, citrate, lactate, maleate, tartrate, methanesulfonate, and the like. Also contemplated are salts of amino acids such as arginate and the like and gluconate, galacturonate (see, for example, Berge S. M., et al., "Pharmaceutical Salts," *J. of Pharmaceutical Science*, 1977, *66*, 1-19).

[0073] The acid addition salts of the basic compounds can be prepared by contacting the free base form with a sufficient amount of the desired acid to produce the salt in the conventional manner. The free base form can be regenerated by contacting the salt form with a base and isolating the free base in the conventional manner. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free base for purposes of the present invention.

[0074] Another aspect of the invention provides intermediates of Formula I' and II", useful in preparing compounds of Formula I and II.

[0075] Compounds of Formula r' and II" where W is O can be prepared by hydrolyzing precursor sulfones such as If, 2e, IIIg shown in the following Schemes 1-4 in refluxing aqueous acetic acid or aqueous hydroxide to provide a hydroxyl compound (i.e., compounds I' and II", wherein $R^{10}W$ is hydroxy). The resulting hydroxyl compound can be alkylated with R^{10}-L where L is a leaving group to provide compounds of Formula I' and II", where W is O and R^{10} is as described. [0076] The compounds of the present invention can be prepared by a variety of methods. In one aspect of the present invention, a method for preparing compounds of Formula I where Z is N is shown in Scheme 1 below. It should be appreciated that although the scheme often indicates exact structures, methods of the present invention apply widely to analogous compounds of Formula I or II, given appropriate consideration to protection and deprotection of reactive functional groups by methods standard to the art of organic chemistry. For example, hydroxy groups, in order to prevent unwanted side reactions, sometimes need to be converted to ethers or esters during chemical reactions at other sites in the molecule. The hydroxy protecting group is then removed to provide the free hydroxy group. Similarly, amino groups and carboxylic acid groups can be derivatized to protect them against unwanted side reactions. Typical protecting groups, and methods for attaching and cleaving them, are described fully in the above incorporated references by T.W. Greene and P.G.M. Wuts, *Protective Groups in Organic Synthesis,* 3rd edition, John Wiley & Sons, New York, 1999, and Harrison and Harrison et al., *Compendium of Synthetic Organic Methods,* Vols. 1-8 (John Wiley and Sons, 1971-1996).

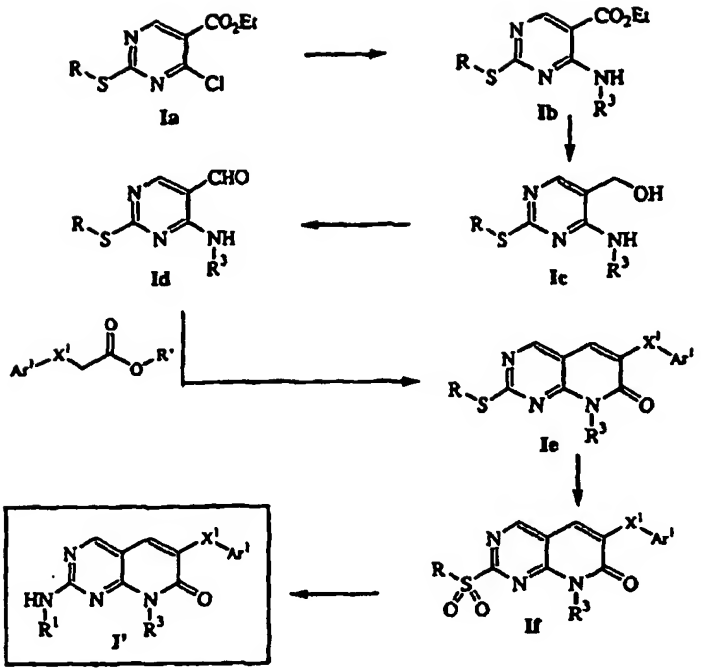


Scheme 1

[0077] Treatment of a compound of Formula Ia with a primary amine (R^3-NH_2) provides a compound of Formula Ib. This reaction is conveniently carried out in a solvent which is inert under the reaction conditions, preferably a halogenated aliphatic hydrocarbon, especially dichloromethane, an optionally halogenated aromatic hydrocarbon, or an open-chain or cyclic ether such as tetrahydrofuran, a formamide or a lower alkanol. Suitably, the reaction is carried out at about -20°C to about 120 °C.

[0078] Reduction of a compound of Formula Ib provides an alcohol of Formula Ic. This reduction is typically carried out using lithium aluminum hydride in a manner well known to those of skill in the art (e.g., in a solvent which is inert under the conditions of the reduction, preferably an open-chain or cyclic ether, especially tetrahydrofuran, at about -20°C to about 70 °C, preferably at about 0 °C to about room temperature).

[0079] Oxidation of an alcohol of Formula Ic provides a carboxaldehyde of Formula Id. The oxidation is typically carried out with manganese dioxide, although numerous other methods can also be employed (see, for example, ADVANCED ORGANIC CHEMISTRY, 4TH ED., March, John Wiley & Sons, New York (1992)). Depending on the oxidizing agent employed, the reaction is carried out conveniently in a solvent which is inert under the specific oxidation conditions, preferably a halogenated aliphatic hydrocarbon, especially dichloromethane, or an optionally halogenated aromatic hydrocarbon. Suitably, the oxidation is carried out at about 0 °C to about 60 °C.

[0080] Reaction of a carboxaldehyde of Formula Id with an ester, Ar^1-X^1CH_2-CO_2R' (where R' is an alkyl group, and Ar^1 and X^1 are those defined above) in the presence of a base provides a compound of Formula Ie. Any relatively non-nucleophilic base can be used including carbonates, such as potassium carbonate, lithium carbonate, and sodium carbonate; bicarbonates, such as potassium bicarbonate, lithium bicarbonate, and sodium bicarbonate; amines, such as secondary and tertiary amines; and resin bound amines such as 1,3,4,6,7,8-hexahydro-2H pyrimido[1,2-a]pyrimidine. Conveniently, the reaction is carried out in a solvent which is relatively polar but inert under the reaction conditions, preferably an amide such as dimethyl formamide, N-substituted pyrrolidinone, especially 1-methyl-2-pyrrolidinone, and at a temperature of about 25°C to about 150 °C.

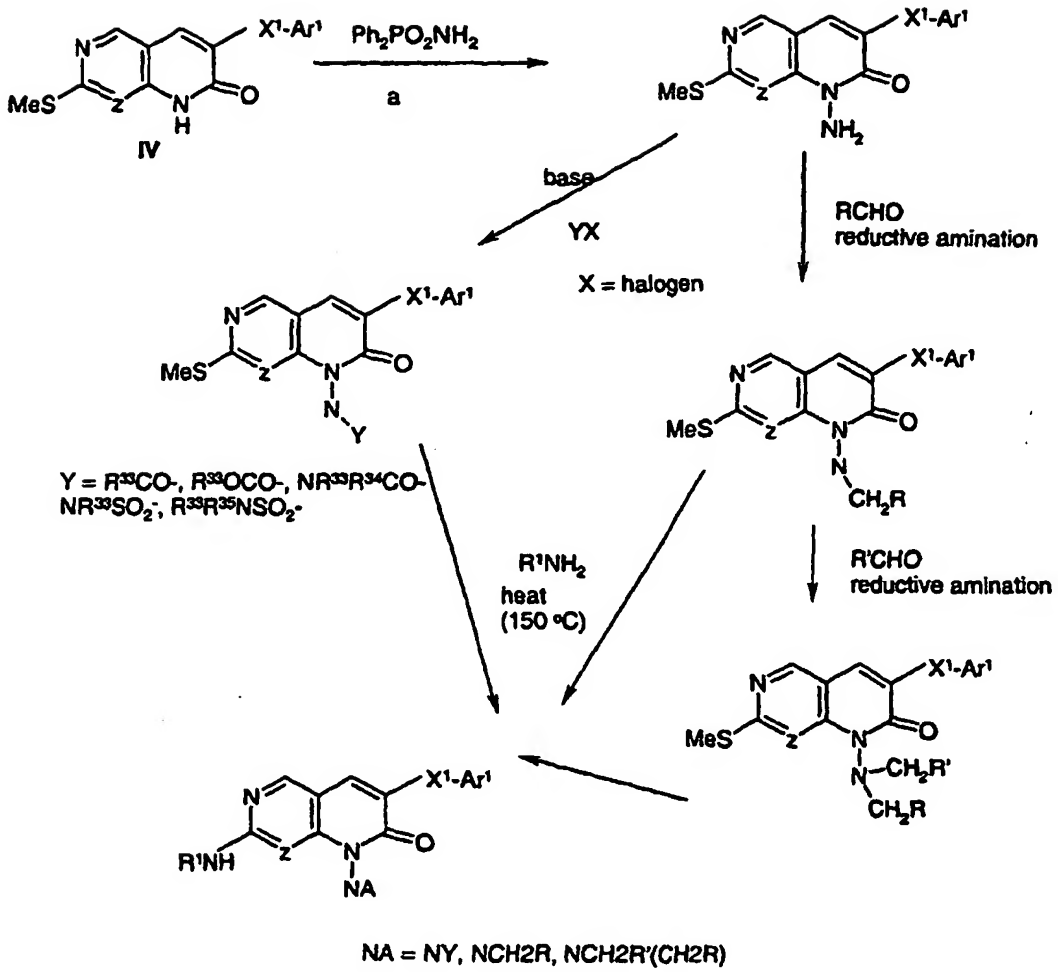
[0081] Oxidation of Ie with an oxidizing agent, e.g. a peracid such as 3-chloroperbenzoic acid (i.e., MCPBA) or Oxone®, provides a sulfone (If) which can be converted to a variety of target compounds. Typically the oxidation of Ie is carried out in a solvent which is inert under the conditions of the oxidation. For example, when MCPBA is used as the oxidizing agent, the solvent is preferably a halogenated aliphatic hydrocarbon, especially chloroform. When Oxone® is used as the oxidizing agent, the solvent is preferably methanol, aqueous ethanol or aqueous tetrahydrofuran. The reaction temperature depends on the solvent used. For an organic solvent, the reaction temperature is generally at about -20°C to about 50 °C, preferably about 0 °C to about room temperature. When water is used as the solvent, the

reaction temperature is generally from about 0 °C to about 50 °C, preferably about 0 °C to about room temperature. Alternatively, the oxidation may be carried under catalytic conditions with rhenium/peroxide based reagents, see ("Oxidation of Sulfoxides by Hydrogen Peroxide, Catalyzed by Methyltrioxorhenium(VII)", Lahti, David W.; Espenson, James H, Inorg. Chem. (2000) 39(10) pp.2164-2167; "Rhenium oxo complexes in catalytic oxidations, Catal. Today (2000) 55(4), pp317-363 and "A Simple and Efficient Method for the Preparation of Pyridine N-Oxides", Coperet, Christophe; Adolfsson, Hans; Khuong, Tinh-Alfredo V.; Yudin, Andrei K.; Sharpless, K. Barry, J. Org. Chem. (1998) 63(5), pp1740-1741).

[0082] Reacting the compound If with an amine (R^1-NH_2) provides the compounds of Formula I' (i.e., compounds I, wherein W is NH). Further alkylation of I' then provides compounds of Formula I, where W is NR^2, where R^2 is alkyl. The reaction can be carried out in the presence or absence of solvent. Conveniently, the reaction is carried out at temperatures of from about 0 °C to about 200 °C, more preferably about room temperature to about 150 °C. Alternatively, in some cases rather than using the sulfone If, the sulfide Ie or the corresponding sulfoxide can be reacted directly with an amine (R^1-NH_2) to provide the compounds of Formula I'.

[0083] Accordingly, the present invention provides a method of preparing compounds of Formula I, by treating a compound of general Formula Ie, If or the corresponding sulfoxide with an amine (R^1-NH_2) and optionally reacting the resulting product with R^2-L, where R^2 is is alkyl and L is a leaving group.

[0084] Compounds of Formula I where R^3 is amino, monoalkylamino, dialkylamino or NR^{32}-Y^3-R^{33} may be prepared as shown in Scheme 2 from the corresponding 2-alkylthio-8-amino-[2,3-d]pyridopyrimidin-7(8H)-one (IV, Z=N) or 7-alkylthio-1-amino-1,6-naphthyridin-2-one (IV, Z=CH) shown in Scheme 2 by amination with O-diphenylphosphinylhydroxylamine.

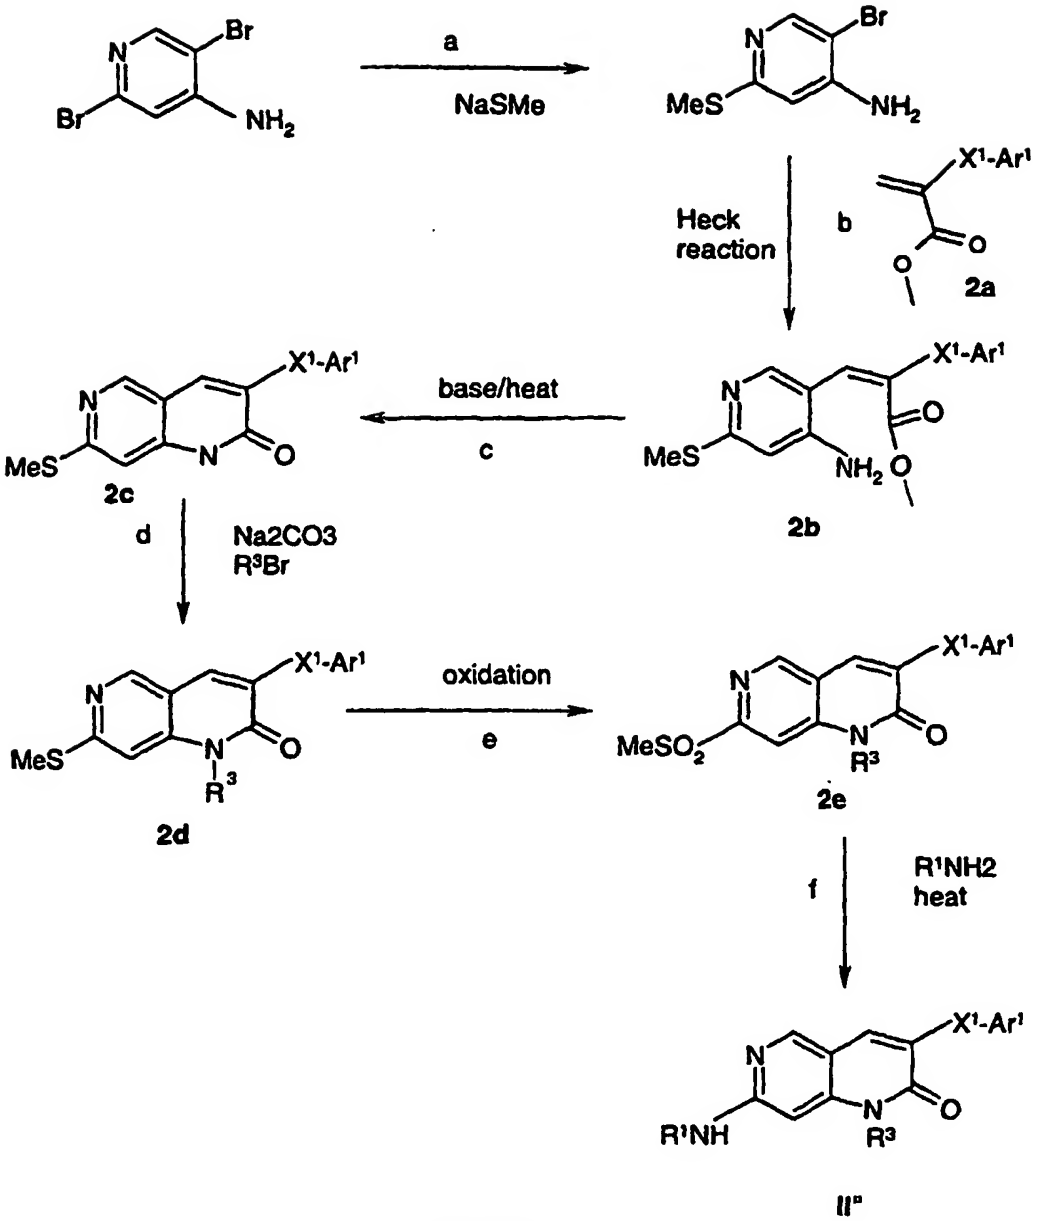


a. The aminating reagent (O-diphenylphosphinylhydroxylamine) was prepared acording to literature procedure (Colvin, E.W.; Kirby, G.W.; Wilson, A.C. Tetrahedron Lett. 1982, 23, 3835. For its use see:
Klottzer, W.; Stadlwieser, J.; Raneburger, J. Org. Synth. 1986, 64, 96-103.

Scheme 2

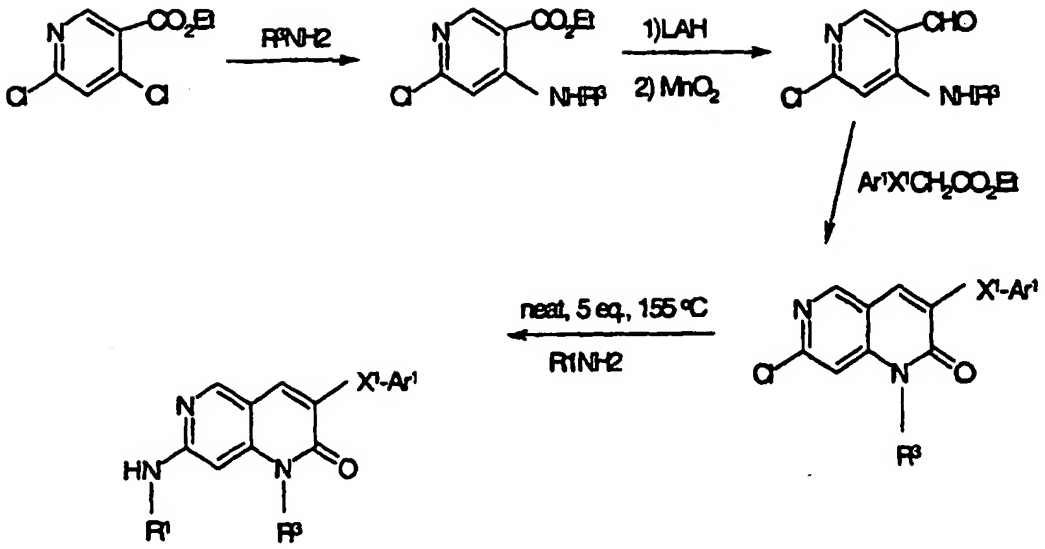
[0085] Displacement of the sulfide (or the corresponding sulfoxide or sulfone with an amine R^1NH_2 as previously described for compound Ie in Scheme 1 provides compounds of Formula I (compounds of Formula I where Z is CH and R^2 is H). Reacting the resulting product with R^2-L, where R^2 is is alkyl and L is a leaving group gives compounds of Formula I where R^2 is alkyl.

[0086] Compounds of Formula I where Z is CH may be prepared as shown in Scheme 3.



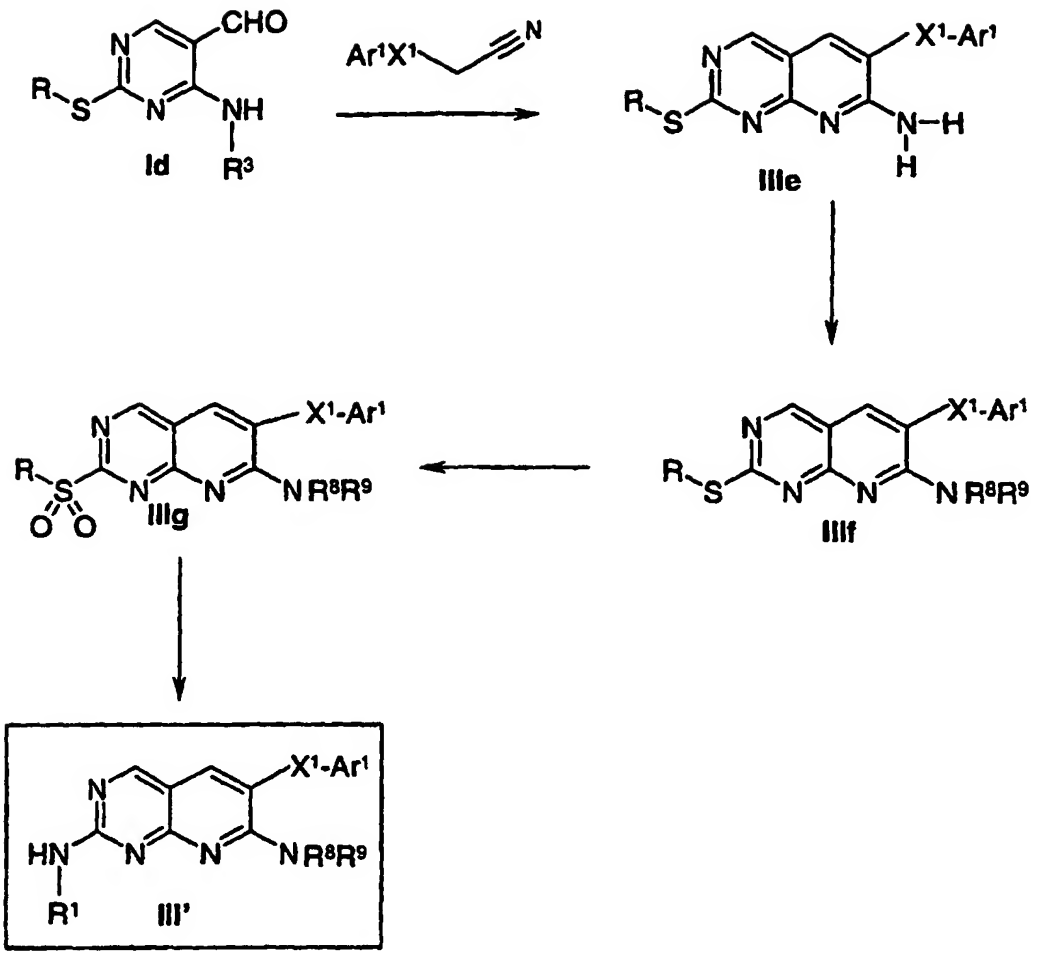
Scheme 3

[0087] 4-amino-3,6-dibromo-pyridine (Den Hertog et. al., Rec. Trav. Chim. Pays-Bas, 64 85-100 (1945) is treated with sodium methyl thiolate to give 4-amino-3-bromo-6-methylthio-pyridine (Step a, see Windscheif, P; Voegtle, F.; Synthesis, 87092 (1994). The methylthiopyridine is coupled in a Heck reaction under palladium catalysis (e.g. palladium acetate) in the presence of base (e.g. potassium acetate or tributylamine) with the vinyl ester 2a to give a compound of Formula 2b (see Dong, Y.; Busacca, C.A. J. Org. Chem., 62, 6464-65 (1997). Ring closure under basic conditions gives a 1,6-naphthyridone of Formula 2c. Alkylation of 2c with an alkyl halide (or any other alkylating agent R^3-X where X is a leaving group) gives a 1-alkylated naphthyridone of Formula 2d. Oxidation of 2d and displacement of the sulfone with an amine R^1NH_2 as previously described for compound Ie in Scheme 1 provides compounds of Formula I" (compounds of Formula I where Z is CH and R^2 is H). Reacting the resulting product with R^2-L, where R^2 is alkyl and L is a leaving group gives compounds of Formula I where R^2 is alkyl.An alternative route is shown in Scheme 3A.



[0088] An example of this route is shown in Example 88.

[0089] Compounds of Formula II may be prepared as shown in Scheme 4.



Scheme 4

[0090] Reaction of a carboxaldehyde of Formula Id (R^3 is H) with a nitrile, Ar^1-X^1CH_2-CN (where Ar^1 and X^1 are those defined above) in the presence of a base under condtions similar to those described for conversion of Id to Ie in Scheme 1 provides a compound of Formula IIIe. Compounds of Formula IIIe may be sequentially alkylated, acylated or sulfonylated with alkylating agents, acyl halides, isocyanates, anhydrides and sulfonyl halides to provide compounds of Formula IIIf where R^8 and R^9 are as described in the Summary of the Invention. Subsequent oxidation of IIIf and displacement of the sulfone with an amine R^1NH_2 as previously described for compound Ie in Scheme 1 provides compounds of Formula III'. Further reacting the resulting product with R^2-L, where R^2 is is alkyl and L is a leaving group gives compounds of Formula II where R^2 is alkyl.

[0091] One of skill in the art will understand that certain modifications to the above schemes are contemplated and within the scope of the present invention. For example, certain steps will involve the use of protecting groups for functional groups that are not compatible with particular reaction conditions.

[0092] The compounds of Formula I and II and the pharmaceutically acceptable salts of basic compounds of Formula I and II with acids can be used as medicaments, *e.g.*, in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered enterally, *e.g.*, orally in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, nasally, *e.g.*, in the form of nasal sprays, or rectally, *e.g.*, in the form of suppositories. However, they may also be administered parenterally, *e.g.*, in the form of injection solutions.

[0093] The compounds of Formula I and II and their aforementioned pharmaceutically acceptable salts can be processed with pharmaceutically inert, organic or inorganic carriers for the production of pharmaceutical preparations. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts and the like can be used, for example, as such

carriers for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carriers for soft gelatine capsules are, for example, vegetable oils, waxes, fats, semi-solid and liquid polyols and the like; depending on the nature of the active ingredient no carriers are, however, usually required in the case of soft gelatine capsules. Suitable carriers for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar, glucose and the like. Suitable carriers for suppositories are, for example, natural or hardened oils, waxes, fats, semi-liquid or liquid polyols and the like.

[0094] The pharmaceutical preparations can also contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain therapeutically valuable substances other than the compounds of Formula I and II and their aforementioned pharmaceutically acceptable salts.

[0095] Medicaments which contain a compound of Formula I or II or a pharmaceutically acceptable salt of a basic compound of Formula I or II with an acid in association with a compatible pharmaceutical carrier material are also an object of the present invention, as is a process for the production of such medicaments which comprises bringing one or more of these compounds or salts and, if desired, one or more other therapeutically valuable substances into a galenical administration form together with a compatible pharmaceutical carrier.

[0096] As mentioned earlier, the compounds of Formula I and II and their aforementioned pharmaceutically acceptable salts can be used in accordance with the invention as therapeutically active substances, especially as antiinflammatory agents or for the prevention of graft rejection following transplant surgery. The dosage can vary within wide limits and will, of course, be fitted to the individual requirements in each particular case. In general, in the case of administration to adults a convenient daily dosage should be about 0.1 mg/kg to about 100 mg/kg, preferably about 0.5 mg/kg to about 5 mg/kg. The daily dosage may be administered as a single dose or in divided doses and, in addition, the upper dosage limit referred to earlier may be exceeded when this is found to be indicated.

[0097] Finally, the use of compounds of Formula I and II and their aforementioned pharmaceutically acceptable salts for the production of medicaments, especially in the treatment or prophylaxis of inflammatory, immunological, oncological, bronchopulmonary, dermatological and cardiovascular disorders, in the treatment of asthma, central nervous system disorders or diabetic complications or for the prevention of graft rejection following transplant surgery, is also an object of the invention.

[0098] Compounds of Formula I and II would be useful for, but not limited to, the treatment of any disorder or disease state in a human, or other mammal, which is exacerbated or caused by excessive or unregulated TNF or p38 kinase production by such mammal. Accordingly, the present invention provides a method of treating a cytokine-mediated disease which comprises administering an effective cytokine-interfering amount of a compound of Formula I, or a pharmaceutically acceptable salt or tautomer thereof.

[0099] Compounds of Formula I and II would be useful for, but not limited to, the treatment of inflammation in a subject, and for use as antipyretics for the treatment of fever. Compounds of the invention would be useful to treat arthritis, including but not limited to, rheumatoid arthritis, spondyloarthropathies, gouty arthritis, osteoarthritis, systemic lupus erythematosus and juvenile arthritis, osteoarthritis, gouty arthritis and other arthritic conditions. Such compounds would be useful for the treatment of pulmonary disorders or lung inflammation, including adult respiratory distress syndrome, pulmonary sarcoidosis, asthma, silicosis, and chronic pulmonary inflammatory disease. The compounds are also useful for the treatment of viral and bacterial infections, including sepsis, septic shock, gram negative sepsis, malaria, meningitis, cachexia secondary to infection or malignancy, cachexia secondary to acquired immune deficiency syndrome (AIDS), AIDS, ARC (AIDS related complex), pneumonia, and herpes virus. [0103] As used herein, the term "TNF mediated disorder" refers to any and all disorders and disease states in which TNF plays a role, either by control of TNF itself, or by TNF causing another monokine to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to TNF, would therefore be considered a disorder mediated by TNF.

[0104] As used herein, the term "p38 mediated disorder" refers to any and all disorders and disease states in which p38 plays a role, either by control of p38 itself, or by p38 causing another factor to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to p38, would therefore be considered a disorder mediated by p38.

[0105] As TNF-β has close structural homology with TNF-α (also known as cachectin), and since each induces similar biologic responses and binds to the same cellular receptor, the synthesis of both TNF-α and TNF-β are inhibited by the compounds of the present invention and thus are herein referred to collectively as "TNF" unless specifically delineated otherwise.

The reactiion mixture was cooled, poured into water and extracted with ethyl acetate (2 times, 50 mL). The organic solution was washed with water (5 times, 50 mL) and dried (brine, $MgSO_4$). Evaporation of the solvent under reduced pressure and purified via column chromatography (SiO_2, CH_2Cl_2/ ethyl acetate - 50/50) yielded 0.123 g of the desired product (Mass spec. [0456] A mixture of aminopiperidine (0.125 g, 0.338 mmol), sodium carbonate (0.072 g, 0.677 mmol), and benzenesulfonyl chloride (0.052 mL, 0.406 mmol) in 4 ml dichloromethane was stirred at room temperature for four days. The reaction mixture was purified by column chromatography (SiO_2, CH_2Cl_2/MeOH/NH_3OH - 95/4/1). The column fractions were combined and concentrated under reduced pressure to provide the free amine. This free amine (0.040 g, 0.078 mmol) was dissolved in ethyl acetate (1-2 mL) and hydrochloric acid in ether (1M, 1 eq) was added. Isolation of the solid *via* filtration, followed by rinsing with ether and drying provided 0.032 g of the desired product as the hydrochloride salt (MP = 130.0-135.0 °C).

Example 110: Preparation of 6-(2-ethoxy-4-fluorophenoxy)-8-methyl-2-{[(1-benzylsulfonyl)piperidiny-4-yl]amino} pyrido[2,3-d]pyrimidin-7(8H)-one;

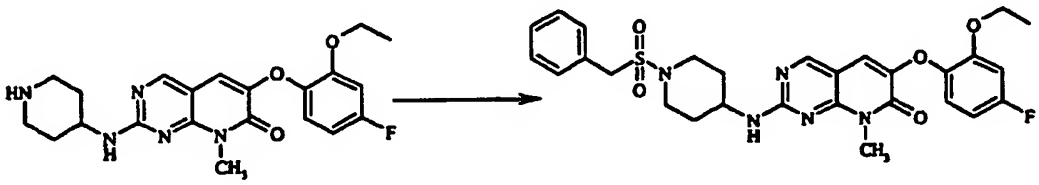
Step A: Preparation of 6-(2-ethoxy-4-fluorophenoxy)-8-methyl-2-(4-piperidylamino)pyrido[2,3-d]pyrimidin-7(8H)-one:

[0457]

[0458] A mixture of ethyl 4-{[6-(2,4-difluorophenoxy)-8-methyl-7-oxo-7,8-dihydropyrido[2,3-*d*]pyrimidin-2-yl]amino} piperidine-1-carboxylate (Example 70, 1.0 g, 2.16 mmol) and potassium hydroxide (2.43 g, 43.2 mmol) in 20 mL of ethanol was refluxed for 17 hours, after which 0.5 mL water was added and reflux continued for another 20 hours before evaporating the reaction volume under reduced pressure. The residue was taken up in 100 ml water and chilled in an ice bath before acidifying with dropwise concentrated HCL The acidic aqueous solution was extracted with dichloromethane (2 times) before being re-alkalized with sodium hydroxide and re-extracted with dichloromethane (2 times). The organic extracts from the alkaline aqueous solution were combined, dried with magnesium sulfate, and dried in vacuo to yield the aminopiperidine (M+1 = 414.1).

Step B: Preparation of 6-(2-ethoxy-4-fluorophenoxy)-8-methyl-2-{[(1-benzylsulfonyl)piperidiny-4-yl]amino}pyrido [2,3-d]pyrimidin-7(8H)-one

[0459]

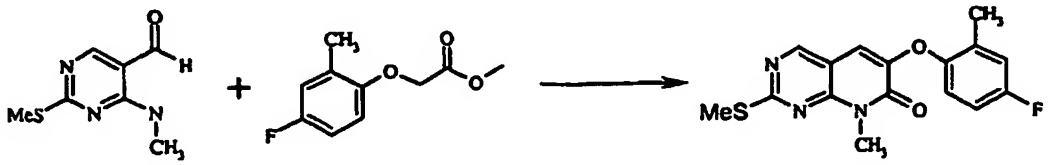


[0460] A portion of the above piperidine (0.150 g, 0.387 mmol) was taken up in 2 mL dichloromethane with sodium carbonate (0.082 g, 0.774 mmol) and α-toluenesulfonyl chloride (0.085 mL, 0.465 mmol) and stirred at room temperature for 17 hours. The reaction mixture was purified by column chromatography (SiO_2, CH_2Cl_2/MeOH- 95/5). The column fractions were combined and concentrated under reduced pressure to provide the free amine. This free amine (0.076 g, 0.140 mmol) was dissolved in methanol (1-2 mL) and hydrochloric acid in ether (1M, 1 eq) was added before evaporation under reduced pressure Isolation of the solid by rinsing with ether, filtration, and drying in vacuo provided 0.031 g of the desired product as the hydrochloride salt (MP = 134.6-187.3 °C).

Example 111: Preparation of 6-(2-methyl-4-fluorophenoxy)-8-methyl-2-{[(1-benzylsulfonyl)piperidiny-4-yl]amino} pyrido[2,3-d]pyrimidin-7(8H)-one

Step A: Preparation of 6-(2-methyl-4-fluorophenoxy)-8-methyl-2-methylthio)pyrido[2,3-d]pyrimidin-7(8H)-one

[0461]



[0462] To a mixture of 4-methylamino-2-methylthiopyrimidine-5-carboxaldehyde (preparation described in Example 1) (7.3 g, 39.6 mmol) and methyl 2-methyl-4-fluorophenoxyacetate (prepared as in Example 4 substituting 2-methyl-4-fluoraphenol for 2-fluorophenol), (11.8 g, 59.4 mmol) in 80 mL of 1-methyl-2-pynolidinone was added potassium carbonate (11.0 g, 79.3 mmol). The reaction mixture was heated to 120 °C and after 3 days, additional phenoxyacetate (15.0 g, 75.7 mmol) was added. After 18 hours of stirring at 120 °C, the reaction was cooled to room temperature and water (1 L) was added. The suspension was stirred for 2 hours then extracted with ethyl acetate (2 times). The combined extracts were washed with water (3 times) and saturated brine, dried with magnesium sulfate, and evaporated in vacuo. The crude solid (10.1 g) was washed with ethyl ether and ethyl acetate, then dried in vacuo, yielding 2.3 g of the pure sulfide (mass spec. M+1 = 332).

Step B: Preparation of 6-(2-methyl-4-fluorophenoxy)-8-methyl-1-(methylsulfonyl)pyrido[2,3-d]pyrimidin-7(8H)-one

[0463]

[0464] The sulfide (2.3 g, 6.9 mmol) was dissolved in 100 mL of methylene chloride and 3-chloroperbenzoic acid (77%, 3.6 g, 20.6 mmol) was added. The mixture was stirred at room temperature for 2 hours, then poured into aqueous sodium sulfite solution (10%, 100 mL) and stirred for 2 hours at room temperature before partitioning. The organic layer was washed with half-saturated aqueous sodium bicarbonate solution (3 times, 100 mL), dried with magnesium sulfate, and evaporated. The resultant solid was stirred with ether for 1 hour and filtered to yield the sulfone.

Step C: Preparation of 6-(2-methyl-4-fluorophenoxy)-8-methyl-2-(4-piperidylamino)pyrido[2,3-d]pyrimidin-7(8H)-one:

[0465]

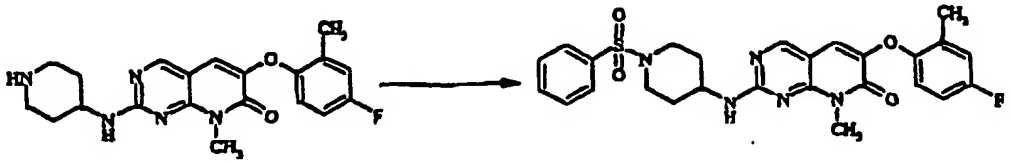
carboxylate in similar fashion as described in example 70). was isolated as the hydrochloride salt (mp 184.0-210.3 °C), 1.03 g of this ethyl carbamate (2.26 mmol) and potassium hydroxide (4.81 g, 85.7 mmol) in 60 ml ethanol was refluxed for 3 days and evaporated in vacuo. The residue was dissolved in aqueous hydrochloric acid (2M) and extracted with dichloromethane (2 times), then chilled in an ice bath and re-alkalized with solid sodium hydroxide. The resultant oily precipitate was decanted and washed with methanol and dichloromethane, dried with sodium carbonate, and evaporated in vacuo to yield 0.550 g of the desired piperidine.

Step D: Preparation of 6-(2-methyl-4-fluorophenoxy)-8-methyl-2-{[(1-benzylsulfonyl)piperidiny-4-yl]amino}pyrido [2,3-d]pyrimidin-7(8H)-one

[0467]

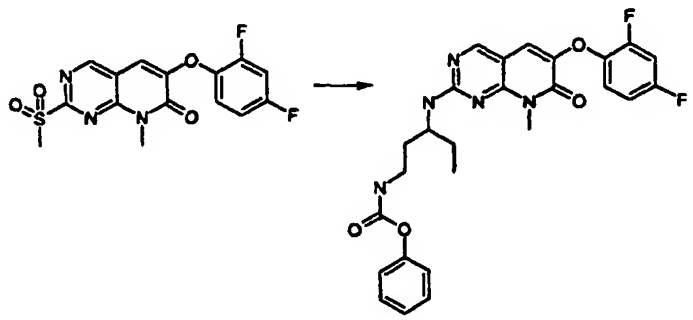


[0468] A mixture of the piperidine (0.125 g, 0.326 mmol), sodium carbonate (0.069 g, 0.652 mmol), and benzenesulfonyl chloride (0.050 ml, 0.391 mmol) in 2 ml dichloromethane was stirred at room temperature for 5 days and purified by column chromatography (SiO_2, CH_2Cl_2/MeOH- 95/5). The column fractions were combined and concentrated under reduced pressure to provide the free amine. This free amine (0.185 g, 0.353 mmol) was dissolved in ethyl acetate (1-2 mL) and hydrochloric acid in ether (1M, 1 eq) was added. Isolation of the solid by filtration, rinsing with ether, and drying in vacuo provided 0.156 g of the hydrochloride salt (MP = 115.2-122.9 °C).

Example 112: Preparation of 6-(2,4-difluorophenoxy)-8-methyl-2- (N^1-methylsulfonyl)-1,3-diaminopentane) pyrido [2,3-d] pyrimidin-7 (8H)-one

Step A: Preparation of 6-(2,4-difluorophenoxy)-8-methyl-2- (N^1-(carbobenzyloxy)-1,3-diaminopentane) pyrido [2,3-d] pyrimidin-7 (8H)-one

[0469]



[0470] Sulfone 5 (0.47 g, 6.4 mmol) was dissolved in anhydrous THF to which was added N^1- (carbobenzyloxy)-1,3-diaminopentane (Org. Prep. and Proceed. Int., 30(3), 339-348 (1998)), (1.52 g, 6.4 mmol) and stirred overnight at 23° under nitrogen. Concentrated under vacuum to give crude oil that was dissolved up with dichloromethane washed with saturated sodium bicarbonate, washed with brine and dried ($MgSO_4$). Filtered and concentrated to give crude oil which was chromatographed on silica gel eluding with 2% methanol in dichloromethane to give 0.657 g 6-(2,4-difluorophenoxy)-8-methyl-2- (N^1-(carbobenzyloxy)-1,3-diaminopentane) pyrido [2,3-d] pyrimidin-7 (8H)-one (mass spec. Example 113 : Preparation of 4-Amino-2-methylthiopyrimidine-5-carbaldehyde

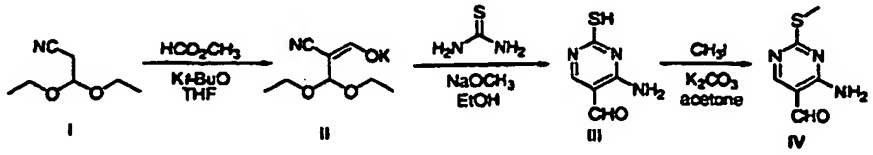
[0473]



Preparation of 3,3-Diethoxy-2-formylpropionitrile Potassium Salt (II)

[0474] To a stirred solution of 3,3-diethoxypropane-nitrile (I, 283.80 g, 1.98 moles) and methyl formate (148.80 g, 2.48 moles) in anhydrous THF (1.1 L) at 10°C was added 1.0 M potassium *tert*-butoxide in THF (2.2 L, 2.2 moles). Temperature was maintained in the range of 10 °C to 15 °C throughout the 45 minute addition. Following the addition, the resulting slurry was stirred 2 hours at ambient room temperature. Hexane (400 mL) was then added and stirring was continued for another 20 min. The slurry was filtered and the cake washed with 1/1 hexanes/THF and dried overnight at 60 °C in a vacuum oven. The yield of pale tan powder was 302.5 grams (73.0%). ^{1}H-NMR (CD_3OD) was consistent with the desired structure II.

Preparation of 4-Amino-2-sulfanylpyrimidine-5-carbaldehyde (III)

[0475] A slurry of thiourea (92.8 g, 1.22 moles) in ethanol (90 mL) was heated under reflux and vigorously stirred. To this slurry was added a suspension of 3,3-diethoxy-2-formylpropionitrile potassium salt II (222.20 g, 1.06 moles) in 25% sodium methoxide/methanol (85.5 mL, 0.37 mole) and ethanol (285 mL) in five aliquots over a 10 minute period while maintaining reflux conditions (alternatively, the latter slurry may be heated to 50°C to give a homogenous solution for the addition). An additional portion of ethanol (150 mL) was added to facilitate stirring. The thick slurry became a bright yellow color following the addition and was held under reflux for an additional 1 hour. The mixture was then

cooled and evaporated to near dryness on a rotoevaporator. The residue was dissolved in water (940 mL). Crude product was precipitated from solution by the addition of 30% acetic acid (280 mL) and isolated via filtration using a medium frit sintered glass filtration funnel. The cake was washed with water (800 mL). Purification via trituration in hot water (1 L) for 30 minutes, followed by cooling and filtration gave 118.9 grams (72.3%) of product as a bright yellow solid after drying overnight at 60°C in a vacuum oven (subsequent preparations have demonstrated that this trituration is unnecessary). An HPLC gave purity as 98.67%. ^{1}H-NMR (DMSO-d_6) was consistent with desired structure III.

Preparation of 4-Amino-2-methylthiopyrimidine-5-carbaldehyde (IV)

[0476] To a solution of 4-amino-2-sulfanyl-pyrimidine-5-carbaldehyde III (100.00 g, 644.4 mmoles) and 325 mesh potassium carbonate (178.10 g, 1.29 moles) in acetone (1.5 L) was added iodomethane (128.10 g, 902.2 mmoles) dropwise over 20 minutes with mild cooling. The mixture was stirred at ambient room temperature over the weekend. TLC showed remaining III and an additional aliquot of iodomethane was added (8 mL) and stirring was continued overnight. TLC again showed some III remaining and an addition portion of iodomethane was added (8 mL) and stirring was continued another 24 hour period. An HPLC showed 95.9% S-alkylated product and 3.7% of compound III. The reaction mixture was stripped to near dryness on a rotoevaporator. Water (1 L) was added to the residue and the product was collected via filtration and washed with water (200 mL). The product was dried overnight in a vacuum oven at 60 °C. Yield was 103.37 grams (94.8%). An HPLC showed 95.8% IV and 4.2% III.

Example 114

[0477] This example illustrates a p38 (MAP) kinase *in vitro* assay useful for evaluating the compounds of the present invention.

[0478] The p-38 MAP kinase inhibitory activity of compounds of this invention *in vitro* was determined by measuring the transfer of the γ-phosphate from γ-^{33}P-ATP by p-38 kinase to Myelin Basic Protein (MBP), using a minor modification of the method described in Ahn, *et al., J. Biol. Chem.* 266:4220-4227 (1991).

[0479] The phosphorylated form of the recombinant p38 MAP kinase was co-expressed with SEK-1 and MEKK in E. Coli (*see,* Khokhlatchev, *et al., J. Biol. Chem.* 272:11057-11062 (1997)) and then purified by affinity chromatography using a Nickel column.

[0480] The phosphorylated p38 MAP kinase was diluted in kinase buffer (20 mM 3-(N-morpholino)propanesulfonic acid, pH 7.2, 25 mM β-glycerol phosphate, 5 mM ethylene glycol-bis(beta-aminoethyl ether)-N,N,N',N'-tetraacetic acid, 1 mM sodium ortho-vanadate, 1 mM dithiothreitol, 40 mM magnesium chloride). Test compound dissolved in DMSO or only DMSO (control) was added and the samples were incubated for 10 min at 30°C. The kinase reaction was initiated by the addition of a substrate cocktail containing MBP and γ-^{33}P-ATP. After incubating for an additional 20 min at 30°C, the reaction was terminated by adding 0.75% phosphoric acid. The phosphorylated MBP was then separated from the residual γ-^{33}P-ATP using a phosphocellulose membrane (Millipore, Bedfrod, MA, USA) and quantitated using a scintillation counter (Packard, Meriden, CT, USA).

Example 115

[0481] This example illustrates an *in vitro* assay to evaluate the inhibition of LPS-induced TNF-α production in THP1 cells.

[0482] The ability of the compounds of this invention to inhibit the TNF-α release was determined using a minor modification of the methods described in Blifeld, *et al. Transplantation*, 51:498-503 (1991).

(a) Induction of TNF biosynthesis:

THP-1 cells were suspended in culture medium [RPMI (Gibco-BRL, Gailthersburg, MD, USA) containing 15% fetal bovine serum, 0.02 mM 2-mercaptoethanol], at a concentration of 2.5 x 10^6 cells/mL and then plated in 96 well plate (0.2 mL aliquots in each well). Test compounds were dissolved in DMSO and then diluted with the culture medium such that the final DMSO concentration was 5%. Twenty five µL aliquots of test solution or only medium with DMSO (control) were added to each well. The cells were incubated for 30 min., at 37 °C. LPS (Sigma, St. Louis, MO, USA) was added to the wells at a final concentration of 0.5 µg/ml, and cells were incubated for an additional 2 h. At the end of the incubation period, culture supernatants were collected and the amount of TNF-α present was determined using an ELISA assay as described below.

(b) ELISA Assay:

The amount of human TNF-α present was determined by a specific trapping ELISA assay using two anti-TNF-α antibodies (2TNF-H12 and 2TNF-H34) described in Reimund, J. M., et al. *GUT.* Vol. 39(5), 684-689 (1996).

Polystyrene 96-well plates were coated with 50 µl per well of antibody 2TNF-H12 in PBS (10 µg/mL) and

incubated in a humidified chamber at 4 °C overnight. The plates were washed with PBS and then blocked with 5% nonfat-dry milk in PBS for 1 hour at room temperature and washed with 0.1% BSA (bovine serum albumin) in PBS.

TNF standards were prepared from a stock solution of human recombinant TNF-α (R&D Systems, Minneapolis, MN). The concentration of the standards in the assay began at 10 ng/mL followed by 6 half log serial dilutions.

Twenty five µL aliquots of the above culture supernatants or TNF standards or only medium (control) were mixed with 25 µL aliquots of biotinylated monoclonal antibody 2TNF-H34 (2 µg/mL in PBS containing 0.1% BSA) and then added to each well. The samples were incubated for 2 hr at room temperature with gentle shaking and then washed 3 times with 0.1% BSA in PBS. 50 µl of peroxidase-streptavidin (Zymed, S. San Francisco, CA, USA) solution containing 0.416 µg/mL of peroxidase-streptavidin and 0.1% BSA in PBS was added to each well. The samples were incubated for an additional 1 hr at room temperature and then washed 4 times with 0.1% BSA in PBS. Fifty µL of O-phenylenediamine solution (1 µg/mL O-phenylene-diamine and 0.03 % hydrogen peroxide in 0.2M citrate buffer pH 4.5) was added to each well and the samples were incubated in the dark for 30 min., at room temperature. Optical density of the sample and the reference were read at 450 nm and 650 nm, respectively. TNF-α levels were determined from a graph relating the optical density at 450 nm to the concentration used.

The IC_{50} value was defined as the concentration of the test compound corresponding to half-maximal reduction in 450 nm absorbance.

Example 116

[0483] This example illustrates an *in vivo* assay to evaluate the inhibition of LPS-induced TNF-α production in mice (or rats).

[0484] The ability of the compounds of this invention to inhibit the TNF-α release, *in vivo,* was determined using a minor modification of the methods described in described in Zanetti, *et. al., J. Immunol.*, 148:1890 (1992) and Sekut, *et. al., J. Lab. Clin. Med.*, 124:813 (1994).

[0485] Female BALB/c mice weighing 18-21 grams (Charles River, Hollister, CA, USA) were acclimated for one week. Groups containing 8 mice each were dosed orally either with the test compounds suspended or dissolved in an aqueous vehicle containing 0.9% sodium chloride, 0.5% sodium carboxymethyl-cellulose, 0.4% polysorbate 80,0.9% benzyl alcohol (CMC vehicle) or only vehicle (control group). After 30 min., the mice were injected intraperitoneally with 20 µg of LPS (Sigma, St. Louis, MO). After 1.5 h, the mice were sacrificed by CO_2 inhalation and blood was harvested by cardiocentesis. Blood was clarified by centrifugation at 15,600 X g for 5 min., and sera were transferred to clean tubes and frozen at -20°C until analyzed for TNF-α by ELISA assay (Biosource International, Camarillo, CA, USA) following the manufacturer's protocol.

[0486] Representative compounds of the present invention are shown in Table 1 and Table 2 below. Compounds of Table 1 and 2 have IC_{50} activity against p38 kinase in the range of from about 0.1 to 5000 nM, with the majority being between 1 to 1000 nM and are surprisingly selective for p38 kinase relative to cyclin-dependent kinases and tyrosine kinase. IC_{50} data for specific compounds are provided in units, whereby a unit (micromolar) in the tables of "0.01" corresponds to 10 nM.
